### INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference <b>SCB506PCT</b>	<b>FOR FURTHER ACTION</b> see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.	
International application No. <b>PCT/EP 99/ 07887</b>	International filing date (day/month/year) <b>18/10/1999</b>	(Earliest) Priority Date (day/month/year) <b>30/10/1998</b>
Applicant  <b>DOMPE' S.P.A et al</b>		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 2 sheets.

☒ It is also accompanied by a copy of each prior art document cited in this report.

**1. Basis of the report**

- a. With regard to the **language**, the international search was carried out on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.

☐ the international search was carried out on the basis of a translation of the international application furnished to this Authority (Rule 23.1(b)).

- b. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international search was carried out on the basis of the sequence listing :

☐ contained in the international application in written form.

☐ filed together with the international application in computer readable form.

☐ furnished subsequently to this Authority in written form.

☐ furnished subsequently to this Authority in computer readable form.

☐ the statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.

☐ the statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished

2. ☐ **Certain claims were found unsearchable** (See Box I).

3. ☐ **Unity of invention is lacking** (see Box II).

4. With regard to the **title**,

☒ the text is approved as submitted by the applicant.

☐ the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

☒ the text is approved as submitted by the applicant.

☐ the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the **drawings** to be published with the abstract is Figure No.

☐ as suggested by the applicant.

☐ because the applicant failed to suggest a figure.

☐ because this figure better characterizes the invention.

None of the figures.

**THIS PAGE BLANK (USPTO)**

# INTERNATIONAL SEARCH REPORT

National Application No

PCT/EP 99/07887

## A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 C07C67/317 C07C333/02 C07C51/377 C07C69/738 C07C59/84

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 C07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category °	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	MELVIN S. NEWMAN ET AL.: "The Conversion of Phenols to Thiophenols via Dialkylthiocarbamates" JOURNAL OF ORGANIC CHEMISTRY., vol. 31, no. 12, December 1966 (1966-12), pages 3980-3984, XP002129225 AMERICAN CHEMICAL SOCIETY. EASTON., US ISSN: 0022-3263 cited in the application the whole document -----	1

☐ Further documents are listed in the continuation of box C.

☐ Patent family members are listed in annex.

### ° Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- "&" document member of the same patent family

## Continuation of Box No. III FURTHER APPLICANT(S) AND/OR (FURTHER) INVENTOR(S)

*If none of the following sub-boxes is used, this sheet should not be included in the request.*

Name and address: (Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below.)

CESTA, Maria Candida  
Via Campo di Pile  
67100 L'AQUILA  
Italy

This person is:

- ☐ applicant only  
☒ applicant and inventor  
☐ inventor only (If this check-box is marked, do not fill in below.)

State (that is, country) of nationality:

Italy

State (that is, country) of residence:

Italy

This person is applicant for the purposes of:

- ☐ all designated States ☐ all designated States except the United States of America ☒ the United States of America only ☐ the States indicated in the Supplemental Box

Name and address: (Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below.)

MANTOVANINI, Marco  
Via Campo di Pile  
67100 L'AQUILA  
Italy

This person is:

- ☐ applicant only  
☒ applicant and inventor  
☐ inventor only (If this check-box is marked, do not fill in below.)

State (that is, country) of nationality:

Italy

State (that is, country) of residence:

Italy

This person is applicant for the purposes of:

- ☐ all designated States ☐ all designated States except the United States of America ☒ the United States of America only ☐ the States indicated in the Supplemental Box

Name and address: (Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below.)

NICOLINI, Luca  
Via Campo di Pile  
67100 L'AQUILA  
Italy

This person is:

- ☐ applicant only  
☒ applicant and inventor  
☐ inventor only (If this check-box is marked, do not fill in below.)

State (that is, country) of nationality:

Italy

State (that is, country) of residence:

Italy

This person is applicant for the purposes of:

- ☐ all designated States ☐ all designated States except the United States of America ☒ the United States of America only ☐ the States indicated in the Supplemental Box

Name and address: (Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below.)

This person is:

- ☐ applicant only  
☐ applicant and inventor  
☐ inventor only (If this check-box is marked, do not fill in below.)

State (that is, country) of nationality:

State (that is, country) of residence:

This person is applicant for the purposes of:

- ☐ all designated States ☐ all designated States except the United States of America ☐ the United States of America only ☐ the States indicated in the Supplemental Box

☐ Further applicants and/or (further) inventors are indicated on another continuation sheet.

## Box No.V DESIGNATION OF STATES

The following designations are hereby made under Rule 4.9(a) (mark the applicable check-boxes; at least one must be marked):

## Regional Patent

- ☒ AP ARIPO Patent: GH Ghana, GM Gambia, KE Kenya, LS Lesotho, MW Malawi, SD Sudan, SL Sierra Leone, SZ Swaziland, UG Uganda, ZW Zimbabwe, and any other State which is a Contracting State of the Harare Protocol and of the PCT
- ☒ EA Eurasian Patent: AM Armenia, AZ Azerbaijan, BY Belarus, KG Kyrgyzstan, KZ Kazakhstan, MD Republic of Moldova, RU Russian Federation, TJ Tajikistan, TM Turkmenistan, and any other State which is a Contracting State of the Eurasian Patent Convention and of the PCT
- ☒ EP European Patent: AT Austria, BE Belgium, CH and LI Switzerland and Liechtenstein, CY Cyprus, DE Germany, DK Denmark, ES Spain, FI Finland, FR France, GB United Kingdom, GR Greece, IE Ireland, IT Italy, LU Luxembourg, MC Monaco, NL Netherlands, PT Portugal, SE Sweden, and any other State which is a Contracting State of the European Patent Convention and of the PCT
- ☒ OA OAPI Patent: BF Burkina Faso, BJ Benin, CF Central African Republic, CG Congo, CI Côte d'Ivoire, CM Cameroon, GA Gabon, GN Guinea, GW Guinea-Bissau, ML Mali, MR Mauritania, NE Niger, SN Senegal, TD Chad, TG Togo, and any other State which is a member State of OAPI and a Contracting State of the PCT (if other kind of protection or treatment desired, specify on dotted line) .....

## National Patent (if other kind of protection or treatment desired, specify on dotted line):

**Precautionary Designation Statement:** In addition to the designations made above, the applicant also makes under Rule 4.9(b) all other designations which would be permitted under the PCT except any designation(s) indicated in the Supplemental Box as being excluded from the scope of this statement. The applicant declares that those additional designations are subject to confirmation and that any designation which is not confirmed before the expiration of 15 months from the priority date is to be regarded as withdrawn by the applicant at the expiration of that time limit. (Confirmation of a designation consists of the filing of a notice specifying that designation and the payment of the designation and confirmation fees. Confirmation must reach the receiving Office within the 15-month time limit.)

**THIS PAGE BLANK (USPTO)**

<b>Box No. VI PRIORITY CLAIM</b>		<input type="checkbox"/> Further priority claims are indicated in the Supplemental Box.		
Filing date of earlier application (day/month/year)	Number of earlier application	Where earlier application is:		
		national application: country	regional application:* regional Office	international application: receiving Office
item (1) 30 Oct 1998 (30.10.98)	MI98A 002332	Italy		
item (2)				
item (3)				

☐ The receiving Office is requested to prepare and transmit to the International Bureau a certified copy of the earlier application(s) (only if the earlier application was filed with the Office which for the purposes of the present international application is the receiving Office) identified above as item(s): \_\_\_\_\_

\* Where the earlier application is an ARIPO application, it is mandatory to indicate in the Supplemental Box at least one country party to the Paris Convention for the Protection of Industrial Property for which that earlier application was filed (Rule 4.10(b)(ii)). See Supplemental Box.

<b>Box No. VII INTERNATIONAL SEARCHING AUTHORITY</b>		
<b>Choice of International Searching Authority (ISA)</b> (if two or more International Searching Authorities are competent to carry out the international search, indicate the Authority chosen; the two-letter code may be used):  ISA /	<b>Request to use results of earlier search; reference to that search (if an earlier search has been carried out by or requested from the International Searching Authority):</b>  Date (day/month/year)                      Number                      Country (or regional Office)	

<b>Box No. VIII CHECK LIST; LANGUAGE OF FILING</b>	
This international application contains the following number of sheets: request : 04 description (excluding sequence listing part) : 10 claims : 04 abstract : 01 drawings : -- sequence listing part of description : Total number of sheets : 19	This international application is accompanied by the item(s) marked below: 1. <input type="checkbox"/> fee calculation sheet 2. <input type="checkbox"/> separate signed power of attorney 3. <input type="checkbox"/> copy of general power of attorney; reference number, if any: 4. <input type="checkbox"/> statement explaining lack of signature 5. <input type="checkbox"/> priority document(s) identified in Box No. VI as item(s): 6. <input type="checkbox"/> translation of international application into (language): 7. <input type="checkbox"/> separate indications concerning deposited microorganism or other biological material 8. <input type="checkbox"/> nucleotide and/or amino acid sequence listing in computer readable form 9. <input checked="" type="checkbox"/> other (specify): Request for fax acknowledgement
Figure of the drawings which should accompany the abstract:	Language of filing of the international application: English

<b>Box No. IX SIGNATURE OF APPLICANT OR AGENT</b>	
Next to each signature, indicate the name of the person signing and the capacity in which the person signs (if such capacity is not obvious from reading the request).  <div style="display: flex; justify-content: space-between; align-items: center;"> <div style="text-align: center;">   <b>Fabrizio MINOJA</b> </div> <div style="text-align: center;"> <b>14 October 1999</b>  <b>(14.10.99)</b> </div> </div>	

For receiving Office use only		2. Drawings:  <input type="checkbox"/> received:  <input type="checkbox"/> not received:
1. Date of actual receipt of the purported international application:	18 OCT 1999 (18.10.99)	
3. Corrected date of actual receipt due to later but timely received papers or drawings completing the purported international application:		
4. Date of timely receipt of the required corrections under PCT Article 11(2):		
5. International Searching Authority (if two or more are competent): ISA /	6. <input type="checkbox"/> Transmittal of search copy delayed until search fee is paid.	

Date of receipt of the record copy by the International Bureau:	For International Bureau use only

# INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No. PCT/EP99/07887

## I. Basis of the report

1. This report has been drawn on the basis of (*substitute sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to the report since they do not contain amendments.*):

### Description, pages:

1-10 as originally filed

### Claims, No.:

1 (part), 2-8 as originally filed

1 (part) as received on 22/08/2000 with letter of 21/08/2000

2. The amendments have resulted in the cancellation of:

- ☐ the description, pages:  
☐ the claims, Nos.:  
☐ the drawings, sheets:

3. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

4. Additional observations, if necessary:

## V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

### 1. Statement

Novelty (N)	Yes:	Claims	1-8
	No:	Claims	
Inventive step (IS)	Yes:	Claims	1-8
	No:	Claims	
Industrial applicability (IA)	Yes:	Claims	1-8
	No:	Claims	

**THIS PAGE BLANK (USPTO)**

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT**

International application No. PCT/EP99/07887

---

**2. Citations and explanations**

**see separate sheet**

**VII. Certain defects in the international application**

The following defects in the form or contents of the international application have been noted:

**see separate sheet**

**THIS PAGE BLANK (USPTO)**

**Re Item V**

**Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

D1 : J. Org. Chem., 31, 1966, 3980-3982 (cited on present page 5, lines 25-309)

**novelty**

None of the documents of the available prior art discloses the present process for making meta- or para-substituted alpha-arylalkanoic acids of formula (I) via the novel intermediates (III) and (IIIb).

The process of document D1 for example mainly differs from the present process by using differently substituted phenols as starting materials for replacing aromatic hydroxyl groups by hydrogen via dialkylthiocarbamates (see D1, table I, page 3982, left column, first paragraph and examples). GB-A 2025397 and WO 98/05632 use different derivatives of the phenolic hydroxyl group to be reduced (see present page 2).

Hence, the subject-matter according to claims 1 to 8 is novel pursuant to Art. 33(2) PCT.

**inventive step**

The subject-matter according to claims 1 to 8 is also based on an inventive step pursuant to Art. 33(3) PCT.

In the light of the more relevant prior art as described on present page 2, lines 10 to 19, the present problem to be solved is seen in the provision of a further process for making arylalkanoic acids of formula (I) from the corresponding alpha-hydroxylated derivatives.

The above problem is solved by the conversion of the phenolic compound (II) to the aryl analog (I) via the O-aryl (III) and S-aryl (IIIb) dialkylthiocarbamoyl derivatives (see claim 1 and the example).

D1 teaches the conversion of a phenolic hydroxyl group to hydrogen via dialkylthiocarbamates (see D1, page 3980, left column, 2nd equation and table I

**THIS PAGE BLANK (USPTO)**

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT - SEPARATE SHEET**

---

International application No. PCT/EP99/07887

and page 3981, right column to page 3982, left column, first paragraph) emphasizing the fact that high yields of the dehydroxylated product are to be obtained only if hydrolysis of the thiocarbamates to thiols occurs prior to Raney Ni treatment (see D1, page 3982, left column, first paragraph and page 3984, right column, compound 22a). The inventive finding in the present process is believed to be that a completely satisfactory desulfuration of the thiocarbamate derivative can be achieved without previously hydrolysing the thiocarbamate as taught in D1 (cf present example). This is seen to be surprising in view of the teaching of D1 and an inventive step can be acknowledged.

The claimed intermediates (III) and (IIIb) according to claims 7 and 8 are seen to be inventive in the course of the present inventive process.

**Re Item VII**

**Certain defects in the international application**

Examples 2 to 5 are not formulated as steps a) to d) of the present process.

**THIS PAGE BLANK (USPTO)**

CLAIMS

1. A process for the preparation of meta or para-substituted  $\alpha$ -arylalkanoic acids of formula (I):

(I)

wherein:

R is hydrogen, C<sub>1</sub>-C<sub>6</sub> alkyl; R<sub>1</sub> is hydrogen, straight or branched C<sub>1</sub>-C<sub>6</sub> alkyl, phenyl, p-nitrophenyl, a cation of an alkali or alkaline-earth metal cation or of a pharmaceutically acceptable ammonium salt; A is C<sub>1</sub>-C<sub>4</sub> alkyl, aryl, aryloxy, arylcarbonyl, 2-, 3- or, 4-pyridocarbonyl, aryl optionally substituted with one or more alkyl, hydroxy, amino, cyano, nitro, alkoxy, haloalkyl, haloalkoxy; A is at the meta or para positions;

which process comprises the following steps:

a) transformation of compounds of formula (II)

(II)

in which P is straight or branched C<sub>1</sub>-C<sub>6</sub> alkyl, phenyl, p-nitrophenyl,

2. Citations and explanations

**see separate sheet**

**VII. Certain defects in the international application**

The following defects in the form or contents of the international application have been noted:

**see separate sheet**

**THIS PAGE BLANK (USPTO)**

**Re Item V**

**Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

D1 : J. Org. Chem., 31, 1966, 3980-3982 (cited on present page 5, lines 25-309)

**novelty**

None of the documents of the available prior art discloses the present process for making meta- or para-substituted alpha-arylalkanoic acids of formula (I) via the novel intermediates (III) and (IIIb).

The process of document D1 for example mainly differs from the present process by using differently substituted phenols as starting materials for replacing aromatic hydroxyl groups by hydrogen via dialkylthiocarbamates (see D1, table I, page 3982, left column, first paragraph and examples). GB-A 2025397 and WO 98/05632 use different derivatives of the phenolic hydroxyl group to be reduced (see present page 2).

Hence, the subject-matter according to claims 1 to 8 is novel pursuant to Art. 33(2) PCT.

**inventive step**

The subject-matter according to claims 1 to 8 is also based on an inventive step pursuant to Art. 33(3) PCT.

In the light of the more relevant prior art as described on present page 2, lines 10 to 19, the present problem to be solved is seen in the provision of a further process for making arylalkanoic acids of formula (I) from the corresponding alpha-hydroxylated derivatives.

The above problem is solved by the conversion of the phenolic compound (II) to the aryl analog (I) via the O-aryl (III) and S-aryl (IIIb) dialkylthiocarbamoyl derivatives (see claim 1 and the example).

D1 teaches the conversion of a phenolic hydroxyl group to hydrogen via dialkylthiocarbamates (see D1, page 3980, left column, 2nd equation and table I

**THIS PAGE BLANK (USPTO)**

and page 3981, right column to page 3982, left column, first paragraph) emphasizing the fact that high yields of the dehydroxylated product are to be obtained only if hydrolysis of the thiocarbamates to thiols occurs prior to Raney Ni treatment (see D1, page 3982, left column, first paragraph and page 3984, right column, compound 22a). The inventive finding in the present process is believed to be that a completely satisfactory desulfuration of the thiocarbamate derivative can be achieved without previously hydrolysing the thiocarbamate as taught in D1 (cf present example). This is seen to be surprising in view of the teaching of D1 and an inventive step can be acknowledged.

The claimed intermediates (III) and (IIIb) according to claims 7 and 8 are seen to be inventive in the course of the present inventive process.

**Re Item VII**

**Certain defects in the international application**

Examples 2 to 5 are not formulated as steps a) to d) of the present process.

**THIS PAGE BLANK (USPTO)**

Applicant <b>DOMPE' S.P.A et al</b>		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 2 sheets.

☒ It is also accompanied by a copy of each prior art document cited in this report.

1. Basis of the report

a. With regard to the **language**, the international search was carried out on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.

☐ the international search was carried out on the basis of a translation of the international application furnished to this Authority (Rule 23.1(b)).

b. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international search was carried out on the basis of the sequence listing :

☐ contained in the international application in written form.

☐ filed together with the international application in computer readable form.

☐ furnished subsequently to this Authority in written form.

☐ furnished subsequently to this Authority in computer readable form.

☐ the statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.

☐ the statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished

2. ☐ **Certain claims were found unsearchable** (See Box I).

3. ☐ **Unity of invention is lacking** (see Box II).

4. With regard to the **title**,

☒ the text is approved as submitted by the applicant.

☐ the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

☒ the text is approved as submitted by the applicant.

☐ the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the **drawings** to be published with the abstract is Figure No.

☐ as suggested by the applicant.

☐ because the applicant failed to suggest a figure.

☐ because this figure better characterizes the invention.

☐ None of the figures.

## INTERNATIONAL SEARCH REPORT

International Application No.

PCT/EP 99/07887

## A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 C07C67/317 C07C333/02 C07C51/377 C07C69/738 C07C59/84

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 C07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	MELVIN S. NEWMAN ET AL.: "The Conversion of Phenols to Thiophenols via Dialkylthiocarbamates" JOURNAL OF ORGANIC CHEMISTRY., vol. 31, no. 12, December 1966 (1966-12), pages 3980-3984, XP002129225 AMERICAN CHEMICAL SOCIETY. EASTON., US ISSN: 0022-3263 cited in the application the whole document -----	1

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

## \* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

# The Conversion of Phenols to Thiophenols via Dialkylthiocarbamates

MELVIN S. NEWMAN AND HAROLD A. KARNES

*The Evans Chemistry Laboratory of The Ohio State University, Columbus, Ohio 43210*

*Received May 9, 1966*

A number of phenols and hydroxyheterocyclic compounds have been converted to the corresponding thiol compounds by the route, phenol to O-aryl dialkylthiocarbamate to S-aryl dialkylthiocarbamate to thiophenol. Methods for accomplishing each step in high yield are described. Since the thiol compounds formed are readily desulfurized by heating with Raney nickel, a useful way of replacing aromatic hydroxyl groups by hydrogen is at hand.

The conversion of a phenol to the corresponding thiophenol represents a transformation for which there has been developed no good general method to date. Prior to the work herein reported this conversion had been effected by pyrolysis of di-O-aryl thiocarbonates (I), to O-aryl S-aryl thiocarbonates (II).<sup>2</sup> Further work showed that over-all conversion in the region of 20-28% of pure materials were obtained.<sup>3</sup> An obvious limitation of this route is that the maximum yield possible is 50% with respect to conversion of a phenol to the corresponding thiophenol.

We now report that pyrolysis of O-aryl dialkylthiocarbamates (III) affords S-aryl dialkylthiocarbamates (IV) in high yields.<sup>4,5</sup> Since phenols are readily converted into the corresponding O-aryl dialkylthiocarbamates (III) in high yield by treatment with dialkylthiocarbamyl chlorides and the S-aryl dialkylthiocarbamates (IV) are readily hydrolysed to the corresponding aryl mercaptans, a general method is now available for the conversion of phenols to thiophenols. In addition, since the hydrogenolysis of S-aryl thiocarbamates to hydrocarbons by Raney nickel proceeds in high yield (see Experimental Section), the over-all conversion of a phenol to the corresponding hydrocarbon may readily be accomplished. Some typical examples of the rearrangements are given in Table I.

The experiments summarized in Table I involved heating of the starting materials neat, except for the few cases noted in which sulfolane was used as solvent. The pyrolysis product (after 25–30 min of heating) was vacuum distilled or sublimed to yield products indicated in Table I. The purity of these materials was a minimum of 95%, as indicated by tlc or nmr analysis or both. The melting points of such products were in general very near that of the recrystallized

(1) The work herein reported was supported by a grant from the Upjohn Co., Kalamazoo, Mich.

(2) A. Schönberg and L. Vargha, *Ber.*, **63**, 178 (1930); A. Schönberg, L. Vargha, and W. Paul, *Ann.*, **483**, 107 (1930).

(3) (a) H. R. Al-Kazimi, D. S. Tarbell, and D. Plant, *J. Am. Chem. Soc.*, **77**, 2479 (1955). See this article for references to other rearrangements from oxygen to sulfur. (b) D. H. Powers and D. S. Tarbell, *ibid.*, **78**, 70 (1956).

(4) Since this work was done, the rearrangement of certain *O*-(2-alkyl-4,6-dinitrophenyl)dialkylthiocarbamates to the corresponding *S*-aryl compounds has been reported. However, the corresponding mercaptans could not be produced; see J. D. Edwards and M. Pianka, *J. Chem. Soc.*, 7338 (1965).

(5) The description of the vapor phase rearrangement at 400° of two O-aryldiethylthiocarbamates to the corresponding S-aryl compound has been reported by H. Kwart and E. R. Evans [*J. Org. Chem.*, **31**, 410 (1966)].

\* The temperature necessary for disappearance in 20 min of the bands in the 1530-1560- (6.5-6.4  $\mu$ ) and 1190-1230-cm<sup>-1</sup> (8.4-8.1  $\mu$ ) regions characteristic of the O-aryl dialkylthiocarbonates (III). After much of the work reported in Table I had been completed, it was discovered that samples deemed to be rearranged completely by infrared analysis above described were not completely free of starting O-aryl compounds III as shown by tlc on silica gel. In five or six representative cases, the experiments were repeated except that an additional 10 min of heating at the designated temperature was effected. The starting materials, III, were then absent. Hence it is assumed that similar results would be obtained in every case in which high yields were obtained. \* The per cent yield is not accurate but was estimated by isolation of essentially pure product. When thin layer chromatography of the crude pyrolysis product showed that essentially only one compound was present, the yield is reported as 95-100%. In all such cases high yields (>90%) of pure product were isolated by suitable means. \* Run in sulfolane, yields determined by isolation. \* Isolated yield. Experiments were run by Fred Hetzel.

products. In those cases where the yields are not very high, the impurity was not starting material. Rather, decomposition products, not examined in detail, were present. The purpose of this work, in general, was to explore the generality of the method rather

than to run detailed studies in any particular case in order to obtain maximum yields.

The rearrangements reported in Table I could be effected by heating at lower temperatures for longer times. For example, 10 and 11 had rearranged to greater than 90% after heating for 4.5 hr at 180°. Attempts to lower the temperature needed for rearrangement of 2 and 20 by adding small amounts of boron fluoride etherate, aluminum, zinc, and ferric chlorides did not yield encouraging results. However, catalytic amounts of boron trifluoride and hydrogen chloride lowered by 60° the temperature needed to cause rearrangement of 6 in 20 min.

The boron trifluoride and hydrogen chloride salts of the 2- and 4-pyridyl 5 and 4 rearranged at room temperature as did the acetyl 4-pyridinium chloride analog. The ready rearrangement of the salts of the 2- and 4-pyridyl compounds at room temperature indicates that this reaction should find wide application in comparable nitrogen heterocyclic systems.

The O-aryl dialkylthiocarbamates (III), were prepared by three general methods, shown below, which are described in detail in the Experimental Section.

Almost all of the O-aryl dialkylthiocarbamates were prepared by method A. The dimethyl compounds were preferred as they crystallized more readily and had higher melting points than the diethyl analogs.

The question as to which Z group, in compounds of formula,  $\text{ArOCSZ}$ , would be more effective in promoting rearrangement to  $\text{ArSCOZ}$  compounds received some attention. From our experience the Z groups  $(\text{CH}_3)_2\text{N}$ ,  $(\text{C}_2\text{H}_5)_2\text{N}$ , and

were best and roughly of equal value. For example, the pyrolysis of diethyl analogs of 11 and 25, Table I, and of morpholino analogs of 2 and 14 gave the rearranged S-aryl compounds in comparable yields under comparable conditions. The rearrangements of O-*p*-nitrophenyl methylphenylthiocarbamate and of O-*p*-nitrophenyl methyl-*p*-nitrophenylthiocarbamate to the corresponding S-aryl compounds also proceeded well. However, if only a monosubstituted nitrogen group is present, e.g., Z =  $\text{RNH}$ , pyrolysis resulted in cleavage to the isothiocyanate,  $\text{RNCS}$ , and  $\text{ArOH}$ .

The pyrolysis of O-*p*-*t*-butylphenyl thiobenzoate, e.g., Z =  $\text{C}_6\text{H}_5$ , for 20 min at 285° yielded only 50% of S-*p*-*t*-butylphenyl thiobenzoate, whereas pyrolysis of 14, Table I, underwent quantitative rearrangement at 270° in 20 min.

Aside from the fact that pyrolysis of di-O-aryl thiocarbonates (I) can give at best a 50% yield of O-aryl S-aryl thiocarbonates (II) the rearrangement of such compounds takes place considerably less readily than that of the corresponding O-aryl thiocarbamates. For example, pyrolysis of di-O-*p*-nitrophenyl thiocarbonate<sup>6</sup> for 20 min at 240° afforded less than 50% of rearranged product, whereas the rearrangement of

O-*p*-nitrophenyl dimethylthiocarbamate (2), Table I, was complete at 180° in 20 min. With the thought that the substitution of a methyl group for one *p*-nitrophenyl group in di-O-*p*-nitrophenyl thiocarbonate might improve the yield of the S-aryl compound, O-methyl O-*p*-nitrophenyl thiocarbonate was prepared and pyrolyzed at 220° for 20 min. No rearrangement to an S-aryl compound of any kind was observed as a mixture of *p*-nitroanisole and S-methyl *p*-nitrophenyl thiocarbonate was obtained.<sup>6</sup>

Although rearrangement of many O-aryl dimethylthiocarbamates to the corresponding S-aryl compounds was successful (see Table I) the following O-aryl analogs did not yield the S-aryl compounds: *o*-acetylphenyl, *o*-acetoxyphenyl, *o*-hydroxyphenyl, *o*-dimethylthiocarbamoylphenyl, and *p*-aminophenyl. In all of these cases, decomposition set in well below the temperature needed for rearrangement. In the case of the *o*-acetylphenyl compound conversion of the acetyl group into the corresponding ketal with ethylene glycol yielded a compound which could be rearranged smoothly (see 21, Table I).

With regard to the effect of structure on the rate of rearrangement of O-aryl dimethylthiocarbamates, examination of the data in Table I reveals that the presence of electron-attracting groups in the aryl portion lowers the temperature needed to a considerable degree.<sup>3b</sup> Also, as noted above, rearrangement of the boron trifluoride and hydrogen chloride salts of 4 and 5 occurred at room temperature. These observations, together with the fact that a dialkylamino group is much better as a Z group than the phenyl or phenoxy group in promoting reaction in compounds of the type  $\text{ArOCSZ}$ , supports the suggestion<sup>3b</sup> that the mechanism of the rearrangement involves nucleophilic attack of the sulfur at the carbon holding the oxygen. The desired polarization is

assisted by the dialkylamino group. The fact that O-*p*-nitrophenyl dimethylthiocarbamate (2) rearranges more readily than O-*p*-nitrophenyl methyl-*p*-nitrophenylthiocarbamate (20 min at 200° needed) supports the above mechanistic interpretation.

The rearrangement of O-*p*-nitrophenyl dimethylthiocarbamate to S-*p*-nitrophenyl dimethylthiocarbamate was shown to be a first-order reaction (see Experimental Section). Presumably, all of the other similar rearrangements proceed intramolecularly.

On alkaline hydrolysis the S-aryl dimethylthiocarbamates afforded the corresponding thiols in high yield. Although all of the S-aryl thiocarbamates studied were not hydrolyzed to thiols, the high yields obtained (see Experimental Section) in selected cases show that the reaction is undoubtedly general. Thus the conversion of a phenolic compound to the thiophenolic analog *via* the O-aryl and S-aryl dialkylthiocarbamyl derivatives is an excellent one. This finding, coupled with the fact that thiohydrogenolysis of the

(6) After completion of this experiment the pyrolysis of O-methyl O-*p*-nitrophenyl thiocarbonate at 180° for 8 hr to yield *p*-nitroanisole (75%) and S-methyl *p*-nitrophenyl thiocarbonate (25%) was reported by G. Hilgetag and R. Phillipson [Monatsber. Deut. Akad. Wiss., Berlin, 6(8), 585 (1964); Chem. Abstr., 63, 5165h (1965)].

thiophenolic compounds is readily accomplished by treatment with Raney nickel<sup>7</sup> make possible an excellent way of replacing a phenolic hydroxyl by hydrogen (see also statement in ref 5). In the latter connection, the failure of S-2-naphthyl dimethylthiocarbamate and S-2,3,5,6-tetramethylphenyl dimethylthiocarbamate to yield more than 30% of naphthalene and durenene shows that hydrolysis to thiols is necessary prior to Raney nickel treatment if high yields are to be obtained.

### Experimental Section<sup>8</sup>

**Preparation of O-Aryl Dimethylthiocarbamates.**—Typical examples are given of the three routes, A-C, mentioned in the introductory part. Route A was used most often. The physical constants and analyses of these compounds are listed in Table II.

**Route A. Example I. O-3-Pyridyl Dimethylthiocarbamate (6).**—To a cooled solution of 58 g (0.6 mole) of 3-pyridinol dissolved in 450 ml of dimethylformamide was added, in small portions, 17 g (0.6 mole) of sodium hydride. After hydrogen evolution ceased the solution was cooled to 10° in an ice bath and 100 g (0.8 mole) of dimethylthiocarbamoyl chloride<sup>9</sup> added all at once. The temperature rose rapidly to 25° and then slowly to 40°. The cooling bath was removed and the mixture heated during 1 hr to 80°. After cooling the mixture was poured into 2 l. of 1% potassium hydroxide. The resulting dark solution was saturated with sodium chloride and then extracted with two 1-l. portions of benzene-Skellysolve B (4:1) (petroleum ether bp 60–70°). Organic extracts were washed with 1-l. of water and 800 ml of 5% hydrochloric acid. The acid wash was cooled and carefully neutralized with 10% potassium hydroxide. The resulting dark red oil was extracted with 1 l. of benzene-Skellysolve B (4:1). The organic extract was washed with saturated sodium chloride, filtered through anhydrous magnesium sulfate, and concentrated to dryness to yield 98 g of a dark oil. Vacuum distillation yielded 95 g (90%) of 6 as a light yellow liquid, bp 125–130° at 0.4 mm.

**Example II. O-*p*-t-Butylphenyl Dimethylthiocarbamate (14).**—To a solution of 21 g (0.17 mole) of dimethylthiocarbamoyl chloride<sup>9</sup> in 140 ml of dimethylformamide at 14° in an ice-water bath was added, all at once, 17.6 g (0.10 mole) of dry sodium *p*-t-butylphenolate. The temperature rose rapidly to 26° and leveled. The cooling bath was removed and the reaction was stirred 1.5 hr at 30–34°. The mixture was added to 300 ml of water and extracted twice with 300-ml portions of benzene-Skellysolve B (4:1). The organic extracts were washed with water, 5% potassium hydroxide, and saturated sodium chloride and filtered through anhydrous magnesium sulfate. Upon concentrating to dryness 22.6 g of yellow solid was obtained which yielded, after recrystallization from 100 ml of methanol, 21.4 g (90.5%) of white crystalline 14, mp 97–99°.

In a similar way, treatment of hydroquinone with diethylthiocarbamyl chloride<sup>10</sup> yielded O,O-bis-*p*-phenylene diethylthiocarbamate, mp 156–160°, in 40% yield.

*Anal.* Calcd for C<sub>18</sub>H<sub>18</sub>N<sub>2</sub>O<sub>2</sub>S<sub>2</sub>: C, 56.4; H, 7.1. Found: 56.4; H, 7.4.

Treatment of catechol with dimethylthiocarbamyl chloride yielded O,O-bis-*o*-phenylene dimethylthiocarbamate, mp 112–113°, in 25% yield. On pyrolysis at 260° black tar was formed.

*Anal.* Calcd for C<sub>12</sub>H<sub>10</sub>N<sub>2</sub>O<sub>2</sub>S<sub>2</sub>: C, 50.7; H, 5.7. Found: C, 50.8; H, 5.6.

In addition to the above bis compound a quantity of O-*o*-hydroxyphenyl dimethylthiocarbamate was obtained by extraction with base. All attempts to obtain an analytically pure sample failed. Pyrolysis of reasonable pure materials yielded black tar. Accordingly the crude product was treated with

acetyl chloride in chloroform to yield a small amount of O-*o*-acetoxyphenyl dimethylthiocarbamate, mp 102–104°. Pyrolysis of this also produced black tar.

*Anal.* Calcd for C<sub>11</sub>H<sub>10</sub>N<sub>2</sub>O<sub>2</sub>S: C, 55.2; H, 5.5. Found: C, 55.4; H, 5.7.

Processing of *p*-aminophenol by route A afforded O-*p*-aminophenyl dimethylthiocarbamate, mp 115–118°, in 30% yield.

*Anal.* Calcd for C<sub>8</sub>H<sub>10</sub>N<sub>2</sub>O<sub>2</sub>S: C, 55.1; H, 6.2. Found: C, 55.3; H, 6.5.

**Route B.**—Procedure B, less often used, involved the reaction of a phenol with a disubstituted thiocarbamoyl chloride in dimethylformamide containing a tertiary amine. This procedure worked well with phenols bearing electron-withdrawing substituents. With phenols bearing electron-donating substituents poor yield were obtained. The procedure worked well with strong bases such as 1,4-diazabicyclo[2.2.2]octane (Dabco)<sup>11</sup> or N-methylmorpholine. With triethylamine or pyridine very poor yields were obtained. The following examples illustrate this procedure.

**Example I. O-*p*-Nitrophenyl Dimethylthiocarbamate (2).**—To 13.9 g (0.1 mole) of *p*-nitrophenol dissolved in 150 ml of dimethylformamide was added 22.4 g (0.2 mole) of Dabco<sup>11</sup> and 18.5 g (0.15 mole) of dimethylthiocarbamoyl chloride. The resulting cloudy solution was stirred for 0.5 hr at 30–35° and then heated over a 0.5 hr period to 75°. After cooling 300 ml of water was added and the mixture was filtered. The solid was washed with 300 ml of water and dried at 50° to yield 24 g of crude yellow product which yielded, after three recrystallizations from ethanol-benzene (4:1), 20.8 g (92%) of yellow crystalline 2, mp 150–153°.

**Example II. O-2-Carbomethoxyphenyl Dimethylthiocarbamate (9).**—To a solution of 7.6 g of methyl salicylate in 75 ml of dimethylformamide containing 16.8 g of Dabco was added 18.5 g of dimethylthiocarbamyl chloride in one portion. The temperature rose rapidly to 50°. The mixture was held at 50° for 5 hr and was then poured into 300 ml of water. The product was taken into benzene-hexane and washed with dilute hydrochloric acid and sodium hydroxide. After drying over magnesium sulfate the solvents were removed and the residue was crystallized twice from methanol to yield 9.6 g (80%) of colorless 9, mp 96–98°. The analytical sample melted at 98–100°.

**Route C.**—The required O-aryl chlorothioformates were prepared essentially as described<sup>12</sup> and used without analysis.

**Example I. O-*p*-t-Butylphenyl Morpholinethiocarbamate.**—To a solution of 8.0 g of O-*p*-t-butylphenyl chlorothioformate in 150 ml of dry ether was added a solution of 10 ml of N-methylmorpholine and 8 ml of morpholine. After 30 min the mixture was washed successively with 5% HCl, 5% Na<sub>2</sub>CO<sub>3</sub>, and saturated NaCl solution, and filtered through anhydrous MgSO<sub>4</sub>. The ether was distilled and the residue was recrystallized twice from methanol to yield 7.5 g (76%) of product, mp 135–137°.

*Anal.* Calcd for C<sub>18</sub>H<sub>21</sub>N<sub>3</sub>O<sub>2</sub>S: C, 64.5; H, 7.6. Found: C, 64.2; H, 7.7.

Similarly, this chlorothioformate was treated with aniline to produce O-*p*-t-butylphenyl phenylthiocarbamate, mp 142–144°, in 45% yield.

*Anal.* Calcd for C<sub>17</sub>H<sub>19</sub>NOS: C, 71.5; H, 6.7. Found: C, 71.6; H, 6.8.

**Example II. O-*p*-Nitrophenyl Methylphenylthiocarbamate.**—To a solution of 6.6 g of O-*p*-nitrophenyl chlorothioformate,<sup>13</sup> mp 58–60°, in 100 ml of benzene was added 8.5 g of N-methylaniline. After 15 min the solid was removed by filtration and the filtrate was washed successively with 5% HCl, 5% Na<sub>2</sub>CO<sub>3</sub>, and saturated NaCl solution, and filtered through MgSO<sub>4</sub>. Removal of the solvent left an oil which solidified. Two recrystallizations from 200-ml portions of ethanol yielded 6.8 g (77%) of product, mp 130–132°.

*Anal.* Calcd for C<sub>14</sub>H<sub>12</sub>N<sub>2</sub>O<sub>2</sub>S: C, 58.3; H, 4.2. Found: C, 58.6; H, 4.3.

Similarly, O-*p*-nitrophenyl methyl-*p*-nitrophenylthiocarbamate, mp 196–203°, and O-*p*-nitrophenyl morpholinethiocarbamate, mp 186–191°, were prepared by treatment of the above chlorothioformate with methyl-*p*-nitrophenylaniline and morpholine, respectively.

*Anal.* Calcd for C<sub>14</sub>H<sub>11</sub>N<sub>3</sub>O<sub>2</sub>S: C, 50.4; H, 3.3. Found: C, 50.3; H, 3.5.

*Anal.* Calcd for  $C_{11}H_{13}N_2O_2S$ : C, 49.2; H, 4.5. Found: C, 49.4; H, 4.8.

**Preparation of Other Sulfur-Containing Derivatives.**—By heating the sodium salt of the required phenol in dimethylformamide with thiobenzoyl chloride, <sup>13</sup>O-*p*-nitrophenyl thiobenzoate, mp 98–100°, and O-*p*-*t*-butylphenyl thiobenzoate, mp 80–82°, were prepared.

*Anal.* Calcd for  $C_{11}H_9NO_2S$ : C, 60.2; H, 3.5. Found: C, 60.0; H, 3.6.

*Anal.* Calcd for  $C_{17}H_{19}OS$ : C, 75.5; H, 6.7. Found: C, 75.5; H, 6.8.

O-*p*-Carboxyphenyl dimethylthiocarbamate (8) was prepared from O-*p*-carboxymethoxyphenyl dimethylthiocarbamate (10) by stirring a solution containing 15 g of 10 in 60 ml of methanol and 120 ml of 10% HCl for 16 hr at reflux. The solid which precipitated on cooling was collected and washed with 400 ml of saturated KHCO<sub>3</sub> solution. Acidification of the filtrate yielded 6 g of solid which on sublimation at 150° at 0.1 mm yielded 3 g of colorless 8, mp 231–245° dec.

**Ethylene Ketal of O-*o*-Acetylphenyl Dimethylthiocarbamate (22).**—O-*o*-Acetylphenyl dimethylthiocarbamate, mp 68–70°, was prepared from *o*-acetylphenol by method A in 60% yield.

*Anal.* Calcd for  $C_{11}H_{13}NO_2S$ : C, 59.2; H, 5.9. Found: C, 59.4; H, 5.8.

A solution of 95 g of O-*o*-acetophenyl dimethylthiocarbamate, 80 ml of ethylene glycol, and 3 drops of concentrated sulfuric acid in 400 ml of benzene was distilled into a short column topped by a phase-separating head for 24 hr. The neutral portion of the reaction products was crystallized three times from methanol to yield 60 g (53%) of colorless 22, mp 78–80°.

**Pyrolysis Experiments.**—In order to arrive at the conditions for carrying out the experiments listed in Table I small amounts of the starting O-aryl dimethylthiocarbamates were heated at various temperatures for varying times. In most cases the progress of the reactions could be followed by thin layer chromatography on silica gel with development by methylene chloride-methanol mixtures or methylene chloride alone. The rearrangements could also be followed by taking infrared spectra (see footnote a, Table I) and by nmr measurements as the N-methyl groups of the O-aryl compounds had a doublet in the  $\tau$  7.3–7.5 [(CH<sub>3</sub>)<sub>2</sub>Si standard] region while the S-aryl compounds had sharp singlets at  $\tau$  7.0–7.1. The S-aryl compounds prepared are listed in Table II.

The following S-*p*-nitrophenyl thiocarbamates not listed in Table II were prepared by heating of the corresponding O-*p*-nitrophenyl thiocarbamates for about 25 min at the temperature indicated: S-*p*-nitrophenyl methylphenylthiocarbamate, mp 163–165°, 180°, 100% yield; S-*p*-nitrophenyl methyl-*p*-nitrophenylthiocarbamate, mp 164–165°, 200°, 90% yield; S-*p*-*t*-butylphenyl morpholinethiocarbamate, mp 92–96°, 280°, 90% yield.

*Anal.* Calcd for  $C_{14}H_{13}N_3O_2S$ : C, 58.3; H, 4.2. Found: C, 58.5; H, 3.9. Calcd for  $C_{14}H_{11}N_3O_2S$ : C, 50.4; H, 3.3. Found: C, 50.5; H, 3.4. Calcd for  $C_{11}H_{13}N_2O_2S$ : C, 49.2; H, 4.5. Found: C, 49.3; H, 4.7. Calcd for  $C_{11}H_{11}NO_2S$ : C, 64.5; H, 7.6. Found: C, 64.5; H, 7.7.

After heating O,O-bis-*p*-phenylene diethylthiocarbamate at 270° for 25 min, a quantitative yield of S,S-bis-*p*-phenylene diethylthiocarbamate, mp 172–175°, was obtained.

*Anal.* Calcd for  $C_{14}H_{14}N_2O_2S_2$ : C, 56.4; H, 7.1. Found: C, 56.7; H, 7.2.

To test the effect of solvent on the rate of rearrangement, solutions of 0.5 g of 2 in 25 ml of dimethylformamide and 25 ml of

1-dodecene were heated at 155–157° for 1 hr. Similarly 0.5 g of 2 alone was heated. The material isolated from the DMF run gave a strong peak at 6.0  $\mu$  (i.e., S-aryl compound) as did the neat sample. The material from the 1-dodecene run showed a very weak carbonyl absorption at 6.0  $\mu$ .

In general no need for solvent in the pyrolyses is present. However, if intermolecular reaction can occur, as in the cases of 8, 17, and 18, Table I, the use of a solvent, e.g., sulfolane, is recommended. When no solvent was used in these cases, the yields of products were much lower.

In order to test the molecularity of the rearrangement reaction solutions containing 50.4 and 250 mg of 2 in 5 ml of polyethylene glycol (Carbowax 400) were heated at 180° for 15 min. Ultraviolet spectral analysis,<sup>14</sup> using a Bausch and Lomb Spectronic 505 instrument, showed that rearrangement to 2a had occurred to the same (within 10%) extent in the two cases. The absorption at 268 m $\mu$  ( $\epsilon$  ca. 30,000) was used to estimate the amount of 2 present and at 320 m $\mu$  ( $\epsilon$  ca. 10,000) to estimate 2a.

**Preparation of Thiophenols.**—In principle, all of the S-aryl compounds listed in Table II could be converted into the corresponding thiophenols. Actually, only a few were so converted. In general a solution of the S-aryl dimethylthiocarbamate in methanol containing excess 10% aqueous sodium hydroxide was heated under nitrogen for times sufficient to effect hydrolysis. Isolation by appropriate procedures yielded *p*-*t*-butylbenzenethiol,<sup>15</sup> bp 102–105° at 7–8 mm, in 85% yield, *o*-mercaptobenzoic acid,<sup>16</sup> mp 160–163°, in 92% yield, 2-methylmercapto-4-mercaptopyrimidine,<sup>17</sup> mp 199–201°, in 81% yield, and 3-phenanthrene-thiol, mp 110–112°, in 83% yield.

*Anal.* Calcd for  $C_{14}H_{10}S$ : C, 80.0; H, 4.8; S, 15.2. Found: C, 79.9; H, 4.8; S, 14.9.

In a similar way, alkaline hydrolysis of 21a yielded an oil, bp 90–100° at 0.2–0.3 mm, in 78% yield. This oil was mainly *o*-(2-methyl-1,3-dioxolan-2-yl)benzenethiol. On low temperature crystallization from methanol the pure compound, mp 42–43°, was obtained.

*Anal.* Calcd for  $C_{10}H_{10}O_2S$ : C, 61.2; H, 6.1. Found: C, 61.5; H, 6.4.

**Thiohydrogenolysis Procedure.**—A solution of 12.5 g of S-2-naphthyl dimethylthiocarbamate (22a) and 4 g of sodium hydroxide in 50 ml of methanol was refluxed overnight under nitrogen. After acidification, 7.9 g of 2-naphthalenethiol,<sup>18</sup> mp 77–78°, was isolated by benzene extraction. This product in 100 ml of ethanol at reflux was treated with 40 g of Raney nickel (W-2)<sup>19</sup> for 8 hr. After removal of the solvent on a rotary evaporator sublimation afforded 6.2 g (98% over-all) of naphthalene, mp 78–79°. In a similar run starting with 22a, only a 30% yield of naphthalene was obtained.

In order to test the effect of steric hindrance on the thiohydrogenolysis, 8.5 g of 13a was hydrolyzed to durenethiol,<sup>20</sup> mp 60.0–61.5° in 88% yield. Hydrogenolysis of 3.5 g of this thiol as above yielded 70% of durene, mp 79–80°. One can conclude from this one experiment<sup>14</sup> that thiohydrogenolysis of a hindered thiol proceeds in good yield but less readily than in unhindered cases.
